

Exponentials, CS-24, Dr. Ostheimer

We set up some notation: Let $f : \mathbf{R} \rightarrow \mathbf{R}$ be given by $f(x) = 3^x$.

And now for your questions:

- (1) What is the domain of f ?
- (2) What is the codomain of f ?
- (3) Is f one-to-one?
- (4) Is f onto?
- (5) Is f a one-to-one correspondence? (Hint: no.)
- (6) Modify the codomain of f to make a new function which we will call g such that g is a one-to-one correspondence. (You are not allowed to change the domain or the formula for f .)

Let g^{-1} denote the inverse of g .

- (1) Compute $g(x)$ for $x = 0, 1, 2, 3$.
- (2) Compute $g^{-1}(x)$ for $x = 1, 3, 9, 27, \dots$

Please turn over.

Have you figured out that $g^{-1}(x) = \log_3(x)$? Now that you know:

(1) Rewrite the equation $g^{-1}(g(x)) = x$ using logs and exponents.

(2) Rewrite the equation $g(g^{-1}(x)) = x$ using logs and exponents.
